Abstracts

According to our (Global Info Research) latest study, the global Digitalization in the Medical Devices market size was valued at US\$ 981 million in 2025 and is forecast to a readjusted size of US\$ 1543 million by 2032 with a CAGR of 6.6% during review period.

Digitalization in the Medical Devices refer to the deep integration of technologies such as the Internet of Things, artificial intelligence, big data, and cloud computing to systematically restructure the entire lifecycle of medical devices, from R&D, production, and distribution to clinical use and adverse event monitoring. This transformation breaks down barriers between medical imaging data, equipment operating status, and hospital information systems by establishing a unified product data model. Its core lies in achieving digital quality control of the production process, remote equipment operation and predictive maintenance, and clinical efficacy analysis based on real-world data. This not only ensures strict compliance with Unique Device Identification (UDI) traceability and the traceability of the production process but also drives continuous product improvement and precision medicine services through a data closed loop, ultimately enhancing patient safety and the quality of medical care.

Digitalization in the Medical Devices industry is at a critical stage, transitioning from compliance and traceability to intelligent upgrading across the entire value chain. Technologically, the Internet of Things (IoT) supports remote equipment operation and maintenance and real-time monitoring of cleanroom environments; artificial intelligence (AI) is widely applied in medical image-assisted diagnosis, visual detection of manufacturing defects, and clinical decision support; blockchain is beginning to explore applications in supply chain traceability and distributor channel management; and cloud computing empowers R&D simulation and compliant data storage. In terms of

development trends, the industry is focusing on building a digital closed loop from R&D and design to manufacturing and clinical use in hospitals, with particular emphasis on UDI (Unique Device Identifier) lifecycle traceability and the value mining of real-world data. Driving factors primarily include mandatory compliance requirements from global regulatory agencies for medical device traceability and transparency, medical institutions' demands for improved equipment availability and clinical efficacy, and market competition forcing companies to reduce costs and increase efficiency through digitalization. However, its development also faces significant obstacles: stringent regulatory verification requirements make any digital transformation cycle long and costly; the wide variety of medical devices and their varying batch sizes make production automation and digital transformation difficult; the serious problem of data silos means that internal enterprise systems are not fully integrated with hospital information systems and regulatory platforms; in addition, the enormous pressure to comply with medical data security and privacy protection regulations restricts the flow and value release of data.
