Abstracts

According to our (Global Info Research) latest study, the global Dimensionally Stable Anode (DSA) market size was valued at US$ 1346 million in 2025 and is forecast to a readjusted size of US$ 2237 million by 2032 with a CAGR of 7.6% during review period.

Dimensionally Stable Anodes (DSA), also called Mixed metal oxide (MMO) electrodes, are devices with high conductivity and corrosion resistance for use as anodes in electrolysis. They are made by coating a substrate, such as pure titanium plate or expanded mesh, with several kinds of metal oxides. One oxide is usually RuO2, IrO2, or PtO2, which conducts electricity and catalyzes the desired reaction such as the production of chlorine gas. The other metal oxide is typically titanium dioxide which does not conduct or catalyze the reaction, but is cheaper and prevents corrosion of the interior.

Dimensionally Stable Anode (DSA) is the core component of the electrolysis process. Electrolysis technology is the use of electrochemical principles to electrolyze salt solutions through anodes and cathodes to achieve the preparation of new materials. The electrolysis products are important raw materials for the national economy. DSA coated titanium anode plays a decisive role in the electrolysis process. Its performance and structure are not only related to electrolysis energy consumption, product purity and output, but also directly affect the production cost and production environment of downstream enterprises.

With the continuous development of electrolytic product technology, electrode materials have also experienced three generations of technological innovation and development due to their own characteristics. The first generation is traditional graphite electrodes.

The second generation is lead-based alloy electrodes. The third generation is titanium-based metal oxide coated electrodes (Dimensionally Stable Anode). DSA coated titanium anodes have strong corrosion resistance and are more green, energy-saving and efficient. With the improvement of people's environmental awareness, efficient, green and energy-saving titanium anodes will inevitably develop strongly to replace traditional electrodes. At the same time, the proportion of new fields such as water electrolysis to produce hydrogen is gradually increasing, and the market space for related electrode materials in the future is broad.
