## Abstracts

The global Dimethyldioxirane market size is expected to reach \$ 93.84 million by 2032, rising at a market growth of 6.9% CAGR during the forecast period (2026-2032).

Dimethyldioxirane (DMDO) is a highly reactive, volatile organic peroxide (a dioxirane) typically generated in situ from acetone and an oxidant such as potassium peroxymonosulfate (Oxone). It is widely used as a powerful electrophilic oxidizing agent for epoxidation of alkenes, hydroxylation of hydrocarbons, and selective oxidation in fine chemical and pharmaceutical synthesis. The supply chain is on-demand and laboratory-centric rather than bulk commercialized: upstream inputs include acetone (derived from cumene phenol processes) and oxidants like Oxone (from specialty inorganic peroxide producers); midstream involves in situ generation in reactors or continuous-flow systems due to DMDO's instability and short lifetime; downstream use is concentrated in pharmaceuticals, agrochemicals, specialty polymers, and academic research, where high selectivity and mild reaction conditions are required. Because DMDO cannot be safely stored or transported at scale, its market is effectively embedded within end-user synthesis processes rather than existing as a standalone traded chemical commodity. In 2025, global Dimethyldioxirane output was about 3,000 tons with 5,000 tons of capacity, average prices of USD 20,000-35,000 per ton, and gross margins around 36%.

This report studies the global Dimethyldioxirane production, demand, key manufacturers, and key regions.
