Abstracts

According to our (Global Info Research) latest study, the global Diode-pumped Ultrafast Lasers market size was valued at US$ 547 million in 2025 and is forecast to a readjusted size of US$ 1058 million by 2032 with a CAGR of 10.0% during review period.

Ultrafast lasers are ultra-short pulse of light with an electromagnetic pulse whose time duration is of the order of a picosecond or less. These pulses have a broadband optical range, and can be produced by mode-locked oscillators. Ultrafast lasers are commonly referred to as ultrafast events with an amplification of ultra-short pulses which always requires the technique of high pulse amplification, in order to avoid damage to the gain medium of the amplifier. A diode-pump solid-state laser (DPSSL) is a solid-state laser made by pumping a solid gain medium, for example, a ruby or a neodymium-doped YAG crystal, with a laser diode.

Due to the very short pulse duration, ultrafast lasers enable thermal micromachining without any heat generation. Their increasing use in the advanced display repair process has led to a new generation of high-speed, compact, multi-wavelength ultrafast lasers.
