Abstracts

A DIP socket is an electronic accessory used to mount dual in-line package (DIP) components on printed circuit boards (PCBs). These sockets are either square or rectangular in shape and feature two rows of pins on the underside of the socket connected to corresponding push-in mountings on the upper side. The pins are placed through holes in the PCB and soldered onto the tracks etched into the board surface. The component is then pushed into the socket mounting points, securing a good electrical connection between it and the board circuit. The DIP socket is typically used to facilitate easy, non-destructive replacement of DIP components, and are available in single unit form or in strips, which can be cut to size as required.

This report studies the global DIP Socket production, demand, key manufacturers, and key regions.
