Abstracts

The global Direct Air Capture Fans market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Direct air capture (DAC) is the process of removing carbon dioxide (CO₂) directly from the atmosphere using specially designed machines. It involves using large fans to draw air into a device designed to capture CO₂ from the air. The captured CO₂ is then separated from other gases in the air and stored or used in various ways. The technology differs from carbon capture and storage (CCS), which captures CO₂ emitted from industrial processes before releasing it into the atmosphere. In contrast, DAC technology captures CO₂ already present in the air. DAC technology is one of the emerging carbon dioxide removal (CDR) technologies designed to reduce the amount of CO₂ in the atmosphere and mitigate the effects of climate change.

DAC involves five basic steps: 1. Bringing a large amount of air into contact with the adsorbent (e.g. using a large fan) 2. Capturing the carbon dioxide with a liquid or solid adsorbent 3. Regenerating the adsorbent through heat and/or pressure 4. Compression and compression Transport CO₂ to storage site 5. Inject into geological storage; alternatively, captured CO₂ can be used to generate green fuels that replace fossil fuels, but this does not result in carbon storage.
