## Abstracts

According to our (Global Info Research) latest study, the global Direct Air Capture Machines market size was valued at USD 15 million in 2022 and is forecast to a readjusted size of USD 720.8 million by 2029 with a CAGR of 73.5% during review period.

Direct Air Capture Machine is a technology used to remove carbon dioxide (CO<sub>2</sub>) directly from the atmosphere. It is a type of carbon capture and storage (CCS) technology that aims to reduce the concentration of CO<sub>2</sub> in the atmosphere, thus mitigating climate change and its associated impacts.

Direct Air Capture Device is used to capture greenhouse gases such as carbon dioxide (CO<sub>2</sub>) from the atmosphere to reduce atmospheric carbon emissions and combat climate change. In recent years, Direct Air Capture Device technology has attracted significant investment and commercial interest. Many companies and start-ups are working to develop and commercialise DAC technology to meet the needs of climate change response. DAC technology is constantly being improved to increase efficiency, reduce costs and increase capture efficiency. New materials and catalysts are being developed to help increase the rate at which CO<sub>2</sub> is adsorbed and released. Some DAC projects integrate renewable energy sources, such as solar and wind, with capture technologies to reduce energy costs and carbon emissions. This integration contributes to the sustainability of DAC. DAC technologies are seen as a key approach to achieving carbon neutrality and negative emissions targets. A number of companies and international organisations have set zero and negative emissions targets, and DAC has played a role in the achievement of these targets. A number of DAC projects are already in the large-scale testing and implementation phase. These projects plan to

build equipment to enable large-scale CO2 capture and storage in the coming years.
