According to our (Global Info Research) latest study, the global Direct-buried Fiber Cable market size was valued at US\$ 3283 million in 2024 and is forecast to a readjusted size of USD 5346 million by 2031 with a CAGR of 7.2% during review period.

Direct buried optical cable refers to a method of laying optical cables by burying them directly in a trench at a specific depth underground and backfilling them for protection. It is the most widely used and basic laying method in the construction of communication lines, and is suitable for a variety of scenarios such as long-distance trunk lines, metropolitan area networks, and access networks. Direct buried optical cables are buried directly underground without the help of pipelines, overhead and other facilities. The depth of the trench is usually determined according to soil conditions, climate environment and optical cable type, generally 0.8 meters to 1.2 meters. Some scenarios require the installation of protective plates, marking tapes or warning stakes to prevent external damage.
