Abstracts

According to our (Global Info Research) latest study, the global Direct Menthol Fuel Cell market size was valued at US\$ 500 million in 2024 and is forecast to a readjusted size of USD 660 million by 2031 with a CAGR of 4.1% during review period.

The direct menthol fuel cell (DMFCs) are basically a subcategory of proton-exchange fuel cells in which methanol is used as the fuel. The direct menthol fuel cell possess various advantages such as the ease of fuel delivery and storage, ease of transport of methanol, reduced design complexity, lower cost of methanol, lack of humidification requirements and the high power density.

Direct menthol fuel cells are a new type of fuel cell characterized by the use of menthol as fuel. Unlike conventional fuel cells, direct menthol fuel cells do not need to go through a reforming or conversion process, but instead use menthol directly as fuel. Direct menthol fuel cells work on a similar principle to conventional fuel cells, where a fuel (menthol) and an oxidant (usually oxygen) are reacted through an electrochemical reaction to produce electrical and thermal energy. In a direct menthol fuel cell, menthol is supplied as fuel to the fuel electrode and an electric current is generated through an electrochemical reaction. At the same time, oxygen is supplied to the air electrode as an oxidant, where it reacts with menthol under the action of a catalyst to release electrical and thermal energy.
