Direct push drill rigs are specialized machines used for soil sampling, environmental testing, and site investigation without the need for traditional rotary drilling methods. These rigs operate by using hydraulic force to push a sampling tool, probe, or sensor into the ground, allowing for quick and minimally invasive data collection. Unlike traditional drilling, direct push rigs do not rotate the drill pipe; instead, they rely on static weight, percussion, or vibration to advance the tool into the subsurface. This technique is efficient for shallow depths, typically up to 100 feet, and is ideal for collecting soil, groundwater, and gas samples, as well as installing monitoring wells in a variety of ground conditions. The method is widely used in environmental and geotechnical investigations due to its speed, cost-effectiveness, and minimal disturbance to the surrounding area.
