Abstracts

The global Direct Water Atomized Copper Powder Particles market size is expected to reach \$ 1387 million by 2032, rising at a market growth of 3.9% CAGR during the forecast period (2026-2032).

In 2025, global production of direct water atomized copper powder particles reached 49,000 tons, with an average selling price of US\$20,810 per ton. Direct water atomization copper powder particles refer to granular copper powder obtained by directly atomizing molten copper using high-pressure water jets, rapidly cooling and solidifying the molten metal, followed by drying, sieving, and grading. These irregularly shaped particles possess good green strength and are used in applications including powder metallurgy structural parts, sintered oil-impregnated bearings, MIM (Metal Injection Molding), welding/brazing materials, friction materials, electro-carbon products, conductive pastes, electronic copper pastes, heat pipe cores, and diamond tools. These products cover industries such as automotive parts, electronics and electrical engineering, chemical catalysis, welding materials, tooling materials, and industrial machinery. The upstream includes copper cathodes/copper ingots/high-purity copper raw materials; the midstream is the manufacturing process; and the downstream connects to application systems such as automotive powder metallurgy parts, electronics and electrical engineering, thermal management, chemical catalysis, welding materials, tooling materials, additive manufacturing, and industrial machinery. The gross profit margin is approximately 20%-30%.
