Abstracts

The global Disodium Hydrogen Phosphite market size is expected to reach \$ 606 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Disodium Hydrogen Phosphite (Na_2HPO_3) is an inorganic phosphorus compound used primarily as a reducing agent, antioxidant, and stabilizer in electroless nickel plating, water treatment, polymer processing, and specialty chemical formulations, where it helps prevent oxidation, control metal ion behavior, and improve process stability. Its supply chain begins upstream with elemental phosphorus or phosphate rock, which is converted into phosphorous acid (H_3PO_3) through controlled oxidation and hydrolysis, then neutralized with sodium hydroxide or sodium carbonate to form disodium hydrogen phosphite crystals. Midstream producers—typically specialty phosphorus chemical manufacturers—carry out synthesis, purification, crystallization, and drying to meet industrial or electronic-grade specifications. Downstream, the product is distributed through chemical distributors and directly to end users in surface treatment, electronics, plastics compounding, and water-treatment sectors, where it is blended into plating baths, additives, or formulations, making the market closely tied to the broader phosphorus chemicals and specialty industrial chemicals value chain. In 2025, global Disodium Hydrogen Phosphite production reached approximately 195,000 tons against an installed worldwide capacity of about 230,000 tons, with the market operating at an average unit price of roughly USD 1,600–3,200 per metric ton; at these levels, leading producers typically achieve gross margins of around 28%.
