Abstracts

The global Dispensing Machine for Electronic Products market size is expected to reach $ 3825 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

Electronics Manufacturing Dispensing Equipment refers to complete hardware systems used to meter, transport and precisely deposit liquid or paste materials during semiconductor packaging, printed circuit board assembly, electronic-module production and final electronic-product manufacturing.

The dispensed materials mainly include adhesives, sealants, underfills, encapsulants, thermal-interface materials, gap fillers, solder paste, flux, conductive materials and conformal coatings. The materials may be applied through contact needles, non-contact jetting valves, spray heads or precision metering and mixing systems.

The scope includes compact dispensing units, benchtop robots, stand-alone automated cells, in-line systems, jet dispensers, selective coating systems, vacuum potting equipment and one- or multi-component meter-mix-dispense systems. Integrated vision, height sensing, material feeding, degassing, process monitoring and hardware-bound software are included.

Electronic-product vending machines, dispensing materials, manually operated syringes, separately sold valves and needles, general-purpose robots without dispensing packages, semiconductor front-end deposition equipment and dispensing services are excluded.

The modeled 2025 benchmark ASP is US$35,500 per unit, global equipment volume is

+357 96 030922
info@marketpublishers.com

approximately 73.523k units, and the modeled gross-margin range is approximately 28%–46%.

The upstream chain includes motors, motion controllers, industrial computers, cameras, sensors, precision pumps, valves, nozzles, pressure vessels, heaters, vacuum components and fluid-control software. Midstream activities include equipment design, motion-system integration, fluid-path development, vision calibration, process-software development, assembly and system validation. Downstream industries mainly include semiconductor packaging, PCB assembly, consumer electronics, automotive electronics, communications, industrial electronics, medical electronics and optoelectronics.

Contact dispensing uses a needle or nozzle positioned close to the substrate, while non-contact jet dispensing ejects individual droplets without touching the workpiece. Jetting can reduce vertical movement and improve cycle time, but its usable material range depends strongly on viscosity, particle size and valve configuration.

Material viscosity changes with temperature. Small temperature variations can alter dot volume, bead width and flow stability, so temperature control is particularly important for highly viscous adhesives and thermal materials.

Underfill performance depends on capillary flow between the semiconductor package and substrate. Board temperature, component temperature, gap size, material viscosity and dispense pattern affect fill time, fillet shape and void formation.

Two-component materials require stable ratio control and complete mixing. Poor metering accuracy can change curing behaviour, while material remaining inside mixers and hoses must be managed within its usable pot life.

Entrapped air and moisture can create voids in potting and encapsulation. Vacuum material preparation or vacuum dispensing is particularly valuable for power electronics, sensors and high-reliability modules.

Highly filled thermal-interface and gap-filler materials can be abrasive. Pumps, valves, seals and nozzles must therefore be selected for wear resistance as well as dispensing accuracy.

PCB warpage and component-height variation can change the distance between the valve and workpiece. Vision positioning and laser-height compensation help maintain

the programmed dispense path.

A programmed dispense result is not automatically a verified result. Weight checks, flow monitoring, vision inspection and three-dimensional inspection can improve process control and identify missing, oversized or misplaced deposits.

Material-path design affects waste and production uptime. Long hoses, large dead volumes and frequent purging increase material loss, especially when using costly underfills, conductive adhesives and thermal compounds.

Dispensing and curing should be treated as one process. UV exposure, thermal curing, moisture curing or dual-curing conditions must match the deposited material thickness and geometry.

Future development will focus on higher-speed jetting, smaller deposit sizes, advanced-packaging underfill, automated material changeover, closed-loop inspection, digital traceability and lower material waste.

Report Scope

This report studies the global Dispensing Machine for Electronic Products production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Dispensing Machine for Electronic Products and provides market size (US$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year. This report explores demand trends and competition, as well as details the characteristics of Dispensing Machine for Electronic Products that contribute to its increasing demand across many markets.

Highlights and key features of the study

Global Dispensing Machine for Electronic Products total production and demand, 2021-2032, (K Units)

Global Dispensing Machine for Electronic Products total production value, 2021-2032, (USD Million)

Global Dispensing Machine for Electronic Products production by region & country, production, value, CAGR, 2021-2032, (USD Million) & (K Units), (based

on production site)

Global Dispensing Machine for Electronic Products consumption by region & country, CAGR, 2021-2032 & (K Units)

U.S. VS China: Dispensing Machine for Electronic Products domestic production, consumption, key domestic manufacturers and share

Global Dispensing Machine for Electronic Products production by manufacturer, production, price, value and market share 2021-2026, (USD Million) & (K Units)

Global Dispensing Machine for Electronic Products production by Type, production, value, CAGR, 2021-2032, (USD Million) & (K Units)

Global Dispensing Machine for Electronic Products production by Application, production, value, CAGR, 2021-2032, (USD Million) & (K Units)

This report profiles key players in the global Dispensing Machine for Electronic Products market based on the following parameters - company overview, production, value, price, gross margin, product portfolio, geographical presence, and key developments. Key companies covered as a part of this study include Nordson Corporation, Musashi Engineering, Inc., Shenzhen Axxon Automation Co., Ltd., Illinois Tool Works Inc. (ITW EAE), Precision Valve & Automation, Inc., bdtronic GmbH, Atlas Copco EPS GmbH, Fisnar Inc., OK International, Inc. (Techcon), ViscoTec Pumpen- u. Dosiertechnik GmbH, etc.

This report also provides key insights about market drivers, restraints, opportunities, new product launches or approvals.

Stakeholders would have ease in decision-making through various strategy matrices used in analyzing the World Dispensing Machine for Electronic Products market

Detailed Segmentation:

Each section contains quantitative market data including market by value (US$ Millions), volume (production, consumption) & (K Units) and average price (K US$/Unit) by manufacturer, by Type, and by Application. Data is given for the years 2021-2032 by year with 2025 as the base year, 2026 as the estimate year, and 2027-2032 as the
