Disposable Electric Laparoscopic Stapler is a minimally invasive surgical instrument that integrates a DC motor, a circuit board and a mechanical transmission component. It realizes tissue cutting and anastomosis functions through electric control. Its core design adopts a disposable structure to avoid cross infection. The working principle is that the motor drives the staple pusher to advance at a uniform speed, so that the three rows of staggered titanium staples on both sides are synchronously formed and cut off the tissue. It has the characteristics of one-handed operation, adjustable jaw angle and intelligent squeezing. It can significantly shorten the anastomosis time during surgery and effectively reduce the risk of anastomotic fistula and bleeding. The integrated design of its power system, firing mechanism and disposable battery assembly makes the instrument both operationally stable and clinically safe.
