Disposable Electrocoagulation Instruments are a type of active medical device commonly used in surgery. They mainly use the heat energy generated by high-frequency current to achieve the functions of cutting, coagulation and hemostasis of biological tissues. Their core structure is usually composed of a blade, a handle, a manual switch and a cable. They are made of medical stainless steel or tungsten wire and are equipped with a waterproof design to ensure safe operation. According to the control method, they can be divided into hand-controlled and foot-controlled types. They need to be used with high-frequency electric knives to achieve operations such as electrocutting, electrocoagulation, scraping, pushing and aspiration. They are suitable for various clinical scenarios such as general surgery, orthopedics, cardiology, gynecology, urology, neurosurgery, dermatology, and abdominal surgery. They have the advantages of simple operation, safety and reliability, accurate control of cutting depth, reduced operation time, and reduced risk of cross infection. They can quickly and efficiently complete tissue separation and hemostasis, while protecting the surrounding normal tissues. The degree of postoperative pain and edema is relatively mild.
