Abstracts

The global Disposable Radiofrequency Cannula market size is expected to reach \$ 402 million by 2032, rising at a market growth of 8.7% CAGR during the forecast period (2026-2032).

In 2025, global sales of disposable radiofrequency cannulas reached 3.2 million units, with an average selling price of \$68 per unit. Disposable radiofrequency cannulas are sterile, single-use interventional medical devices used for radiofrequency ablation or neuromodulation therapy. They typically consist of a stainless steel needle body, insulating coating, electrode tip, handle interface, and connecting leads. Under image guidance, they are percutaneously inserted into the lesion or nerve target, and then connected to a radiofrequency generator to release high-frequency current, producing thermal coagulation or modulation effects for pain management, tumor ablation, and minimally invasive treatment. The product emphasizes conductivity stability, insulation safety, and precise positioning performance, and belongs to the category of minimally invasive interventional consumables. Upstream raw materials mainly include medical-grade stainless steel tubing, polymer insulating materials, and conductive copper wire; downstream, they are mainly supplied to hospital pain management departments, oncology departments, and minimally invasive surgery departments, and enter medical end-users through a distribution system. The industry's total production capacity is approximately 4 million units per year, with an average gross profit margin of approximately 38%. The future lies in the widespread adoption of precision medicine and minimally invasive treatments, while simultaneously integrating with image-guided systems to improve operational safety. With the aging population and the increasing number of patients with chronic pain, demand continues to expand, and companies with registration qualifications and clinical promotion capabilities will gain more market opportunities.
