A disposable silicone catheter is a medical device used for various clinical procedures that require access to the internal structure of the body. This is a flexible tubular instrument made of silicone material that is disposable and then discarded. Silicone conduits have several advantages over other types of conduits, such as those made of latex or PVC. Silicone is a biocompatible material that is unlikely to cause allergic reactions or irritation. It is also more flexible and durable, reducing the risk of catheter displacement or breakage. In addition, silicone catheters can be used for longer periods of time than other types of catheters, which can reduce the need for frequent catheter replacement.
