Abstracts

Disseminated intravascular coagulation (DIC) is a rare but serious condition that causes abnormal blood clotting throughout the body's blood vessels. You may develop DIC if you have an infection or injury that affects the body's normal blood clotting process. DIC is an acquired clinic biological syndrome characterized by widespread coagulation activation, which results in fibrin deposition in the vasculature, organ dysfunction, clotting factor and platelet consumption, and life-threatening hemorrhage. Several underlying disorders can cause disseminated intravascular coagulation (sepsis, cancer, trauma, and pregnancy complicated with eclampsia or other calamities). The cornerstone therapeutic approaches are treating the underlying disease and eliminating the trigger mechanism. DIC-specific therapeutic strategies aim to reduce blood coagulation activation and bleeding risk. Few clinical trials use DIC as an entry criterion.
