According to our (Global Info Research) latest study, the global Dissolved Airfloatation Unit market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Dissolved airfloatation is an operational process for thickening and clarification applications in water and wastewater treatment through the use of microscopic air bubbles as a driving force. Dissolved air floatation units are widely used in food processing applications, which tend to have water high in oil, fat, and grease content. There are mainly two types of dissolved airfloatation units, namely open tank DAF and plate pack DAF. Among these two, open tank DAFs are ideal for the treatment of wastewater, which is heavily loaded with solids. Plate pack DAFs are suited for low solid loading and high hydraulic rates.

The growing demand for dissolved airfloatation units can be attributed to their effectiveness in clarifying wastewater and their subsequent application in a number of industries. Water processing is a necessity in many industries, including as a solvent and for material production or cleaning processes. Wastewater is also recycled or reused for environmental and economic purposes. Additionally, excessive wear and blockage of pipelines and other connected equipment is minimized, which surges the operating reliability of the production plant. To obtain good water quality, oil, gas and grease components need to be separated, and dissolved airfloatation units are best for this purpose. These units allow for higher loading rates and reduce the necessary size of the basin. All these factors drive the dissolved airfloatation unit market growth.
