North America is the largest market, with a share about 34%, followed by Europe and Asia-Pacific, with the share about 31% and 22%. In terms of product type, Volar Distal Radius Plates and Screws occupy the largest share of the total market, about 91%. And in terms of product Application, the largest application is Hospitals, followed by Orthopedic Clinics.

The radius is one of two forearm bones and is located on the thumb side. The part of the radius connected to the wrist joint is called the distal radius. When the radius breaks near the wrist, it is called a distal radius fracture.

A distal radius fracture, also known as wrist fracture, is a break of the part of the radius bone which is close to the wrist. Symptoms include pain, bruising, and rapid-onset swelling. The wrist may be deformed. The ulna bone may also be broken.

Distal radius plates and screws are orthopedic implants used in the surgical treatment of distal radius fractures. The distal radius refers to the end of the forearm bone (radius) near the wrist joint. When this is fractured, it can cause pain, instability, and limited mobility.

The use of distal radius plates and screws provides several benefits in the treatment of

distal radius fractures. They allow for anatomical reduction of the fracture, meaning the bone fragments can be realigned to their normal position. This promotes better healing and helps restore function to the wrist joint. The plates and screws also provide immediate stability, allowing patients to start early motion exercises and rehabilitation.
