According to our (Global Info Research) latest study, the global Distillation Systems market size was valued at USD 5507.8 million in 2023 and is forecast to a readjusted size of USD 6671.1 million by 2030 with a CAGR of 2.8% during review period.

Distillation is the process of separating the components or substances from a liquid mixture by using selective boiling and condensation. Distillation may result in essentially complete separation (nearly pure components), or it may be a partial separation that increases the concentration of selected components in the mixture. In either case, the process exploits differences in the volatility of the mixture's components. In industrial chemistry, distillation is a unit operation of practically universal importance, but it is a physical separation process, not a chemical reaction.
