A distributed industrial control system is an industrial control system composed of multiple controllers and computing units, used to control and monitor industrial processes. It adopts a modular structure, and each module is independent of each other. The failure of any module will not affect the normal operation of the system.

This system includes multiple components, such as input/output modules, controllers, operating stations, communication networks, etc. Among them, the input/output module is responsible for data exchange with field equipment and converts field signals into digital quantities required by the controller; the controller is the core component of the distributed control system, responsible for processing field signals and reporting them to the actuator. Issue control instructions; the operating station provides the operator with a human-machine interface for monitoring the distributed control system and setting operating parameters; the communication network is the channel for data transmission between various components.

In addition, the distributed industrial control system also has functions such as data acquisition, direct digital control, human-computer interaction, monitoring and management, etc. It is developed on the basis of computer supervisory control system, direct digital control system and computer multi-level control system. , a relatively complete control and management system for the production process.

Intelligent trend: With the development of artificial intelligence, Internet of Things and other technologies, distributed industrial control systems will become more and more intelligent, able to realize functions such as automated control, optimized scheduling, and fault diagnosis, and improve production efficiency and management levels.
