According to our (Global Info Research) latest study, the global Distributed Servo Drives market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Distributed servo drives are servo drive systems where the drive units are distributed near the individual motors. They offer flexibility, scalability, reduced wiring complexity, improved performance, modularity, and energy efficiency. These features make them well-suited for applications that demand precise motion control and coordination of multiple drive axes.

Distributed servo drives, also known as decentralized servo drives or distributed motion control systems, are a type of servo drive architecture where the drive units are distributed or located in close proximity to the individual motors they control. Unlike centralized servo drive systems where a single control unit drives multiple motors, distributed servo drives distribute the control and power electronics to the individual motors or drive axes.
