According to our (Global Info Research) latest study, the global Distribution Automation Devices market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Distribution automation is the process by which the collection of data is automated and analyzed, and then controls executed by Utilities. The ability to apply technology to monitor the physical world is not just distribution automation, but also the process of a smart grid and smart control.

High initial cost of distribution automation has adversely affected the demand for distribution automation. Many utilities, which do not have advanced communication network in the grid, are still reluctant to use the distribution automation technology. Moreover, the use of distribution automation technology increases capital expenditure on additional hardware components in the distribution network. However, this trend is likely to change in the coming years. Distribution automation helps reduce maintenance cost and offers high efficiency, thereby improving the operations within the utility sector and resulting in high level of reliability and efficiency of power in the distribution network.
