According to our (Global Info Research) latest study, the global Distribution Automation Terminals (DTU and FTU) market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Distribution Automation Terminals are an important part of distribution automation systems to deliver real-time monitoring, fault detection, fault location, isolation and power restoration in non-fault areas on multi-line systems. These terminals include distribution terminal units (DTU), feeder terminal units (FTU) and transformer terminal units (TTU). This report only focuses on DTU and FTU products.

DTU is a terminal device of a switching station, generally installed in conventional switching station, outdoor small switching station, ring network cabinet, small substation, box-type substation, etc. It completes the acquisition and calculation of position signal, voltage, current, active power, reactive power, power factor, electric energy and other data of a switching station, performs the switching and closing operation of switches, realizes feeder switch's fault identification, isolation, and recovery power supply of non-faulty areas.

The FTU is a switch monitoring device installed next to the feeder switch, which is generally composed of a main control unit, a battery management unit (responsible for

charge and discharge management) and the battery. FTU supports feeder automation function for automatic fault isolation and to reduce the impact of accidents.
