Abstracts

District Heating is a system for distributing heat generated in a centralized location through a system of insulated pipes for residential and commercial heating requirements such as space heating and water heating.

Scope of the Report:

The heat is often obtained from a cogeneration plant burning fossil fuels or biomass, but heat-only boiler stations, geothermal heating, heat pumps and central solar heating are also used, as well as nuclear power. District heating plants can provide higher efficiencies and better pollution control than localized boilers.

The worldwide market for District Heating is expected to grow at a CAGR of roughly xx% over the next five years, will reach 180000 million US\$ in 2023, from 180000 million US\$ in 2017, according to a new GIR (Global Info Research) study.
