## Abstracts

The global Diver Detection Sonar market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Diver detection sonar is a specialized technology used for the detection and location of divers or underwater threats in coastal and harbor security applications. It employs an underwater sonar system that emits sound waves and analyzes the echoes or reflections to detect and track objects in the water. Diver detection sonar systems are designed to distinguish between normal environmental noise and the unique acoustic signature of a human diver. They can detect and locate divers in real-time, providing early warnings and enhancing situational awareness for security personnel. Diver detection sonar is a critical tool used in maritime security operations to protect sensitive areas, naval vessels, and critical infrastructure from unauthorized access or potential threats.
