## Abstracts

According to our (Global Info Research) latest study, the global Diver Held Sonar market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Diver-held sonar is a portable sonar device that is specifically designed to be operated by a diver underwater. It is used for underwater imaging and mapping, allowing divers to obtain real-time visual feedback of their surroundings and conduct detailed inspections of submerged structures, reefs, or other underwater features. The sonar system typically consists of a handheld unit with a display screen and a transducer that emits and receives sound waves underwater. The transducer sends out sound pulses, which bounce off objects in the water and return to the transducer, creating a visual representation of the underwater environment on the display screen. Diver-held sonars are commonly used in applications such as search and recovery operations, underwater construction, marine research, and underwater archaeology.
