According to our (Global Info Research) latest study, the global Divergent Lens market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The diverging lens is an optical element used to adjust the propagation angle and focal length of a beam of light. Diverging lenses are characterized by a thinner center and thicker edges.

Diverging lenses cause light rays to meet at the surface of the lens and then diverge outward. The radius of curvature of this lens is smaller in the center and larger at the edges, giving it a convex lens shape. Diverging lenses can achieve: expanding light beams, correcting refractive errors, and are widely used.
