## Abstracts

The global Diversity Wireless Microphone market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Interference is the most common problem associated with wireless microphone systems. To be precise, multipath interference is a phenomenon in radio wave physics where waves from a source travel through two or more paths, and under the right conditions, the waves reach the antenna at different times and can cause interference. If left uncorrected, this disruption can be extremely annoying and interrupt a speech or performance. This common problem can be solved through antenna diversity, or the process of using two or more antennas to improve the quality and reliability of the wireless link.
