Abstracts

The global DL-Lactic Acid market size is expected to reach \$ 166 million by 2032, rising at a market growth of 4.7% CAGR during the forecast period (2026-2032).

DL-lactic acid is racemic 2-hydroxypropionic acid composed of equal or nearly equal proportions of D- and L-lactic acid. It is generally supplied as a colorless to pale-yellow viscous liquid and is used in food acidification, pharmaceutical and personal care formulations, cleaning and descaling, leather and textile processing, and fine-chemical synthesis where optical purity is not required. Compared with optically pure L-lactic acid, its main advantages are mature synthetic routes, lower cost, and broad application compatibility, although it is unsuitable for directly producing highly stereoregular PLA. In 2025, global DL-lactic acid Film sales reached approximately 72,000 Ton, with an average price of 1,650 US\$/Ton.

DL-lactic acid benefits from cost and supply-stability advantages in food acidification, pharmaceutical excipients, cosmetic pH adjustment, industrial cleaning, and metal descaling where chirality is not required. Mature synthetic processes provide a consistent racemic composition without dependence on specialized microbial strains. Food processing, pharmaceuticals, and industrial cleaning in developing markets provide stable incremental demand, but global capacity investment is increasingly directed toward renewable fermentation-based L-lactic acid and high-optical-purity polymer grades, while natural-origin and low-carbon preferences create substitution pressure in selected food and personal care applications.

This report studies the global DL-Lactic Acid production, demand, key manufacturers, and key regions.
