Abstracts

According to our (Global Info Research) latest study, the global DMD Maskless Lithography Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

DMD maskless Stepper is a device that uses digital micro display (DMD) technology for lithography. DMD is an optical device based on a micro mirror array, consisting of many small controllable mirrors, each of which can be tilted independently to control the direction of light reflection. In the traditional Stepper, a lithography mask is needed to control the propagation path of light so as to project the pattern onto the photosensitive material. The DMD maskless Stepper changes the direction and intensity of light projection by directly controlling the mirror on the DMD, thus realizing the pattern formation. This technology eliminates the mask making process used in traditional Stepper, making the lithography template more simple and flexible. DMD maskless Stepper is widely used in the field of microelectronics manufacturing and optical device manufacturing. It can be used to manufacture micro nano scale structures such as integrated circuits, display devices, optical devices, etc. Because DMD maskless Stepper has the characteristics of high resolution, high precision and high speed, it plays an important role in micro nano machining and high-precision manufacturing.
