Abstracts

The global DMT Tester market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The DMT tester includes: main control unit, sample support table, diamond indenter, displacement sensor. When using a DMT tester for testing, first set the test parameters. Then, the sample is placed on the sample support table, and the diamond indenter is brought into contact with the material surface. By controlling the main control unit, a constant force is applied and the indenter insertion depth is recorded. Finally, based on the insertion depth and the known force value, the hardness value of the material is calculated. The DMT tester is widely used and can provide important information about material hardness and mechanical properties, which is of great significance to material performance evaluation and quality control.

The DMT tester is a device used to measure the hardness of the surface or coating of a material. It uses a diamond indenter to apply a small force on the surface of the object to be tested, and measures the hardness of the material according to the insertion depth of the indenter.
