## Abstracts

The principle of DNA Encoded Library (DEL) technology is to label each small molecule compound in the reaction process with a small specific DNA sequence, and use the "Split and Pool" strategy of combinatorial chemistry to synthesize compound libraries with DNA sequences of millions or even billions in size. Affinity screening was performed between the DNA coding compound library and the target protein. Compounds that did not effectively bind to the target protein were eluted and removed, resulting in a collection of compounds that can bind to the protein. The DNA sequences of these compounds were amplified and amplified using Polymerase, and then detected by second-generation gene sequencing. Because the DNA sequences correspond one-to-one with small molecule compounds, researchers only need to read the DNA sequences on the molecules that bind to the target protein to decode the molecular structural formula that binds to the target protein.
