Abstracts

DNA gene chips or DNA microarrays are tiny chips that are engrafted with DNA molecules. A DNA gene chip size resembles the size of a postage stamp. A DNA microarray consists of a set of microscopic DNA spots attached on a solid surface. Every DNA spot consists of picomoles of a definite DNA sequence, known as probes. These probes can be a small section of a gene or a DNA element that are used to hybridize a cRNA or cDNA sample (called target) under stringent conditions. These powerful and versatile arrays are frequently used in genetic and medicinal research owing to their ability to speed up the research process.

According to our (Global Info Research) latest study, the global DNA Gene Chip market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

North America is the largest DNA gene chip market owing to favorable government policies and increase in incentives along with technological advancement in DNA gene chip. Europe is the second largest market for DNA gene chip due to growing prevalence of cancer, increasing government initiatives, and rising demand for early detection and diagnosis of cancer.
