Double-arm Operated Walkers are rehabilitative engineering devices designed to assist mobility through coordinated upper-limb manipulation. Based on ergonomic and biomechanical principles, they incorporate symmetrical dual-arm support structures (e.g., adjustable handles, articulated joints, and elastic damping modules) that enable users to achieve weight transfer and gait propulsion via active pushing, pulling, or load-bearing motions. Key functions include dynamic balance support, reduction of lower-limb load, and optimization of movement energy efficiency, with optional integration of intelligent modules (e.g., pressure sensing, gait analysis) for biomechanical feedback. These walkers assist individuals with lower-limb weakness, balance impairments, or neurological injuries by enhancing upper-limb compensation and motor control to improve independent walking and rehabilitation outcomes.

Typical products include: Rehasense's Platform, Kaiyang's KY971, etc.
