The global Double Leaf Mechanical Heart Valve market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Double leaf mechanical heart valves are medical devices used to replace damaged or diseased heart valves. This is an artificial heart valve designed to mimic the function of natural heart valves, which regulate blood flow through the heart. The double leaf mechanical heart valve consists of two metal or plastic leaflets that open and close according to changes in blood pressure. The lobules are connected to a metal or plastic ring implanted in the heart, designed to fully open, allowing blood to flow through the valve, and then tightly close to prevent blood reflux. Double leaf mechanical heart valves are commonly used in patients with severe heart valve disease or injury, as well as in patients who are not suitable for other types of heart valve replacement, such as tissue valves. The design of this device is durable and can provide years of reliable functionality. However, using double leaf mechanical heart valves also carries some risks, including the risk of thrombosis and the necessity of lifelong anticoagulation therapy. Patients receiving double leaf mechanical heart valves require close monitoring by their healthcare provider and regular follow-up care to ensure that the device is functioning properly and to address any potential complications.
