Double-sided carbon-coated copper foil refers to a composite material where a layer of carbon material is coated or plated onto both the front and back surfaces of a copper foil. Typically, this involves applying a 1-3 micrometer (?m) thick layer of conductive carbon material onto both sides of a 9 ?m thick copper substrate, resulting in a surface resistance of less than 30 ohms per 25 square micrometers. Double-sided carbon-coated copper foil exhibits enhanced physical properties such as superior conductivity and lower internal resistance. It also possesses good mechanical strength and toughness, preventing shorts caused by dendrite growth. Furthermore, it demonstrates better adhesion strength with electrode material coatings.
