The global Double Stage Fiber-optic Isolator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Double Stage Fiber-optic Isolator is an essential component in optical communication systems, serving to isolate and protect optical signals from unwanted reflections and backscattering. Its dual-stage design and non-reciprocal behavior make it a valuable tool for enhancing the performance and reliability of optical communication and other related applications.

A Double Stage Fiber-optic Isolator is an optical device used in optical communication systems. It is designed to isolate and reduce the reflection and backscattering of optical signals, thereby enhancing the performance and stability of optical communication systems. The term 'double stage' indicates that this isolator consists of two stages of isolation, allowing effective isolation of the optical signal's propagation direction.
