According to our (Global Info Research) latest study, the global DPF Sensors market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

In diesel engines, pressure sensors are installed before and/or after the diesel particulate filter (DPF). These filters have an optimum operating temperature at which they can efficiently burn off the fine particles captured by the filter. A drop in pressure signals that the filter is starting to fill up. To prevent clogging and ensure optimal performance, the pressure sensor sends a signal to the ECU to raise the temperature of the exhaust gases and enable the filter to regenerate, thereby preserving the life of these filters.
