According to our (Global Info Research) latest study, the global Drainage IoT Monitoring System market size was valued at US\$ 1633 million in 2025 and is forecast to a readjusted size of US\$ 3017 million by 2032 with a CAGR of 9.3% during review period.

The drainage IoT monitoring system is a smart drainage management platform built on sensor networks and data communication technologies. It is primarily used for real-time monitoring and remote management of the operational status of urban drainage networks, storm drains, pumping stations, and sewage treatment facilities. The system typically collects key data through water level sensors, flow meters, liquid level gauges, pressure sensors, and video surveillance equipment, and transmits this data to a cloud platform via NB-IoT, 4G/5G, or wired networks. This enables dynamic analysis and early warning of drainage capacity, network blockage, flooding risks, and equipment operational status. Compared to traditional manual inspection methods, the drainage IoT monitoring system improves response efficiency and scheduling accuracy, making it a crucial digital infrastructure in smart city construction and urban flood control systems.
