Abstracts

The global Drainage IoT Monitoring System market size is expected to reach \$ 3017 million by 2032, rising at a market growth of 9.3% CAGR during the forecast period (2026-2032).

The drainage IoT monitoring system is a smart drainage management platform built on sensor networks and data communication technologies. It is primarily used for real-time monitoring and remote management of the operational status of urban drainage networks, storm drains, pumping stations, and sewage treatment facilities. The system typically collects key data through water level sensors, flow meters, liquid level gauges, pressure sensors, and video surveillance equipment, and transmits this data to a cloud platform via NB-IoT, 4G/5G, or wired networks. This enables dynamic analysis and early warning of drainage capacity, network blockage, flooding risks, and equipment operational status. Compared to traditional manual inspection methods, the drainage IoT monitoring system improves response efficiency and scheduling accuracy, making it a crucial digital infrastructure in smart city construction and urban flood control systems.
