A drilled and slotted brake disc is a type of braking component that combines two distinct design features for enhanced performance. It features a series of drilled holes and slotted grooves on its braking surface. The drilled holes help in reducing weight, improving heat dissipation by allowing air to circulate more freely, and also assist in expelling debris and gases that can build up during braking. The slotted grooves, on the other hand, further aid in heat dissipation, ensure consistent contact between the brake pads and the disc by clearing away brake dust and other particles, and contribute to better braking performance overall. This combination makes the drilled and slotted brake disc a popular choice for vehicles where high-performance braking and efficient heat management are desired, such as in sports cars, high-performance SUVs, and some racing applications.
