Drinking water cables, also known as potable water cables or water-approved cables, are specially designed and certified cables used for the transmission and distribution of electrical power in water supply systems. These cables are specifically designed to ensure that the drinking water supply remains safe and free from contamination.

Drinking water cables are typically made with materials that are approved for contact with potable water, such as cross-linked polyethylene (PEX) or polyvinyl chloride (PVC) with specific additives to meet the drinking water regulations and standards. These materials are chosen for their resistance to water-related hazards such as corrosion, chemical leaching, and bacterial growth. In addition to being made with suitable materials, drinking water cables undergo rigorous testing and certification processes to ensure their compliance with relevant national and international standards for drinking water quality and safety. These standards may include criteria for biological safety, chemical composition, and migration limits. Drinking water cables are commonly used in water treatment plants, pumping stations, pipe networks, and other infrastructure within the water supply system. They are installed and maintained according to specific guidelines to prevent any risk of contamination and ensure the integrity of the drinking water supply.

The Global Info Research report includes an overview of the development of the Drinking Water Cable industry chain, the market status of Drinking Fountains (
