A driver-in-the-loop simulator is a device that combines virtual simulation and actual driving operations to test and evaluate the interaction between the driver and the vehicle system. It places the driver in a simulated driving environment, allowing him to operate in a highly realistic virtual scene. This simulator is usually equipped with a cockpit, steering wheel, pedals, display, force feedback device, etc., so that the driver can get a feeling close to real driving. Driver-in-the-loop simulators are widely used in automotive design, autonomous driving technology research and development, driver training, and traffic safety research. They can test complex driving scenarios, emergencies, or the impact of new technologies on driver behavior without affecting the real world.
