Driverless ride-hailing services refer to vehicle networks that provide on-demand mobility services without human drivers, based on autonomous driving technology and intelligent transportation systems. These services utilize artificial intelligence, LiDAR, cameras, sensors, vehicle-to-everything (V2X) technology, and high-precision maps to enable vehicles to autonomously perceive their environment, plan routes, comply with traffic rules, and safely transport passengers throughout the entire process. It combines the real-time dispatching of traditional ride-hailing services with autonomous driving technology, aiming to improve travel efficiency, reduce operating costs, and provide a safe, convenient, and sustainable travel experience.

Driverless ride-hailing services have enormous development potential in the future. On the one hand, they are expected to significantly reduce travel costs, decrease traffic accident rates, and alleviate urban congestion. On the other hand, with the maturity of technologies such as artificial intelligence, 5G communication, V2X, and high-precision maps, the reliability and commercial feasibility of autonomous vehicles are continuously improving. It is projected that in the next decade, driverless ride-hailing will drive the upgrading of urban shared mobility models, forming a more intelligent, efficient, and environmentally friendly transportation system, while simultaneously driving the development of related industrial chains, including sensor manufacturing, intelligent transportation infrastructure, and data services.
