## Abstracts

According to our (Global Info Research) latest study, the global DrMOS & Multiphase Controller market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

The multiphase controller and DrMOS can form a multiphase power supply (a multiphase power supply is a DC-DC converter in a power management chip. It converts the external DC input voltage into a DC working voltage of a suitable level in the chip and electronic product execution device. It is a type of product used in the low-voltage and high-power field). By using the outputs of multiple step-down circuits in parallel, it can output hundreds of amperes to thousands of amperes of current, and has higher efficiency and lower heat dissipation at the same power, providing a power supply solution for high-performance computing applications.

DrMOS integrates two Mosfet and Mosfet driver into one chip to increase conversion efficiency, reduce electromagnetic interference, and effectively reduce the heat generation of MOS tubes. Especially for the server market, efficiency is an extremely critical indicator.

The multiphase controller is the "brain" of the multi-phase power supply, bridging the CPU/GPU and DrMOS. The multi-phase controller is responsible for communicating with the CPU/GPU, etc., and feeding back the results to the driver, so as to accurately control the circuit.

With the rise of big data, cloud computing, and artificial intelligence, greater computing power and higher power consumption of CPU/GPU/ASIC are needed, which also places

higher requirements on load power supply. Multiphase power supply is recognized as the best solution for such application scenarios and is widely used in data centers, smart driving, communications and other fields.
