According to our (Global Info Research) latest study, the global DrMos Technology market size was valued at US\$ 1255 million in 2024 and is forecast to a readjusted size of USD 2539 million by 2031 with a CAGR of 10.5% during review period.

DrMOS is essentially a voltage regulator module (VRM) using an external pulse-width modulation (PWM) controller in buck configuration. However, unlike traditional buck DC-DC converters, a DrMOS integrates the MOSFET drivers directly on-chip with the power FETs (PDF). As per the Intel specification, the packages for these chipsets are mostly fixed at 5 mm by 5 mm in modern implementations, allowing the VRM to be placed much closer to the load. The integration of the two power stage components, as well as proximity to the load, reduces the parasitic elements and conduction losses leading to an efficiency upwards of 95% in optimized polyphase topologies.

An AI server is a specialized computing system designed to handle the intensive computational tasks associated with artificial intelligence applications. Unlike standard servers, AI servers are optimized with high-performance hardware, such as Graphics Processing Units (GPUs), to efficiently process large volumes of data and execute complex algorithms. This optimization enables them to support various AI workloads, including machine learning, deep learning, and neural network training. The AI server market is a segment within the broader technology sector focused on the production and distribution of servers optimized for AI tasks. This market has been expanding as businesses across various industries adopt AI technologies to improve efficiency, automate processes, and gain competitive advantages. The growing demand for AI servers is closely linked to the increased utilization of AI applications in areas such as data analytics, autonomous vehicles, healthcare, and financial services. The growing demand for specialized AI hardware, including GPUs and TPUs, is driving the DrMos

Power Chip industry. These components provide high performance for complex computations in AI tasks. As organizations invest in advanced AI applications, the need for hardware designed for these workloads increases. This trend is boosting the adoption of AI servers with GPUs and TPUs to meet the needs of modern AI solutions.
