A visible camera sensor is an imager that collects visible light (400~700nm) and converts that to an electrical signal, then organizes that information to render images and video streams. Visible cameras utilize wavelengths of light from 400~700nm, which is the same spectrum that the human eye perceives. Visible cameras are designed to create images that replicate human vision, capturing light in red, green and blue wavelengths (RGB) for accurate color representation.
