## Abstracts

The global Drug Stability Testing market size is expected to reach \$ 782 million by 2032, rising at a market growth of 6.7% CAGR during the forecast period (2026-2032).

Drug stability testing refers to the systematic testing of key quality attributes of drug substances and drug products over time under specified storage conditions (such as temperature, humidity, light exposure, vibration/transportation stress, etc.) to establish/confirm re-test periods or shelf life and label storage conditions.

Because the product lifecycle from clinical trials to commercialization and post-marketing changes is longer and more complex (process scale-up, packaging/factory changes, formulation optimization, etc.), stability testing is increasingly being incorporated into a more systematic lifecycle management and data evaluation system. This emphasizes using stability data to support retesting/expiration date and label storage strategies, and improving decision confidence through statistical evaluation and trend management.

Biopharmaceuticals and advanced therapies (such as cell and gene therapies), as well as small-batch, high-value products, have higher requirements for release and development pacing, driving laboratories to adopt higher-throughput, automated, and faster data acquisition methods (e.g., accelerated/stress studies, rapid microbiological methods, and more refined stability protocols). Simultaneously, regulators are also promoting the integration and updating of stability principles (the FDA released an integrated draft/document of the ICH Q1 stability series in 2025), further strengthening consistency across product types and scenarios.

This report studies the global Drug Stability Testing demand, key companies, and key
